SECTION 01

WELCOME & ABOUT RII

ABOUT US

About RII

Objective, data-driven non-profit

Founded 2016 in Portland, Oregon

Expertise in climate policy, utility programs,
green building certification, sustainable
business, construction & indoor cultivation

In 2020, received 3-year grant from USDA to
develop KPIs, standards & building rating
system for CEA

ABOUT RII

What We Do / Our Mission

We measure, verify & celebrate the world's most efficient agricultural ideas.

Measure

Efficiency & Productivity

- Key Performance Indicators
- Benchmarks
- Baselines

Verify

Best Practices & Standards

- Training
- Policies
- Utility Programs

Celebrate

Leadership Recognition

- Verification
- Case Studies
- Certification

ABOUT RII

Our Network

Technical Advisory Council

Multi-disciplinary body who aggregates knowledge to support producers and other stakeholders with objective and peer-reviewed data and curriculum on benchmarking resource efficiency

- **Guides** development of standards
- **Shapes** tools and resources to support best practices
- **Advocates** for informed policies, incentives and regulations

HVAC - Lighting - Utility - Water
Policy - Data - Controls - Emissions
Facility Design & Construction

PowerScore Benchmarking

Specialized Key Performance Indicators

- Performance Snapshots
 - Year-over-year energy, water, and emissions rankings
 - Third-party data verification
- PowerScore Comply in select jurisdictions
- Access PowerScore Pro as an RII member
 - Enhanced portfolio management
 - Dashboard reports
 - Filters
 - Access Ranked Data Set

Competitive business insights

- Get ahead of compliance
- Assess portfolios of facilities to continuously improve
- Prioritize capital projects
- Forecast KPIs for new facilities and retrofits

Calculated PowerScore

#47974088-21, Indoor, Grantsville, MD, Climate Zone 5A, July 2020 - June 2021

Get Verified

Whole Facility

Energy

45th percentile

Non-Electric Efficiency 188 kBtu / sq ft 30% better 71st percentile

Emissions Efficiency 13.4 kg CO₂e / sq ft 31% better 100th percentile

Best Practices Guides for Producers

Primers for Governments & Utilities

Collaborative Reports on Resource Usage

Intelligence Insights for Members

A wide-angle photograph of a large-scale indoor cannabis cultivation facility. The space is filled with rows of green cannabis plants growing in a structured environment. The ceiling is high and features a complex network of metal trusses, large industrial fans, and numerous hanging grow lights. The lighting is a mix of cool white and warm yellow tones. The plants are densely packed in the foreground and middle ground, with some showing signs of being trained or supported. The overall atmosphere is industrial and controlled.

3C-REN: Tri-County Regional Energy Network

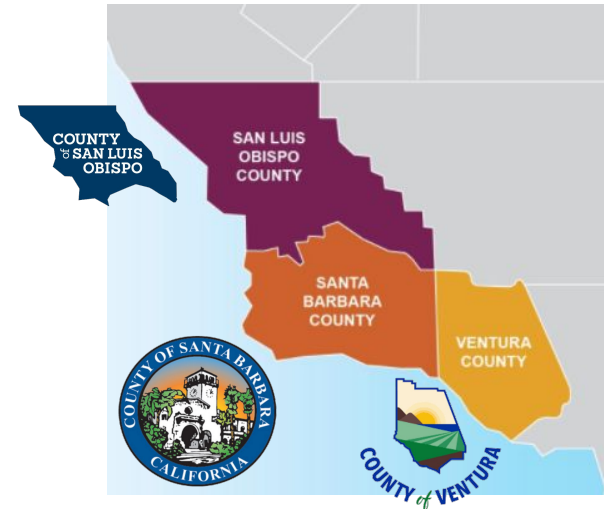

TRI-COUNTY REGIONAL ENERGY NETWORK

SAN LUIS OBISPO • SANTA BARBARA • VENTURA

Three counties working together to improve energy efficiency in the region with free programs:

- Energy Code Connect
 - Building professionals
 - Makes the Energy Code easy to follow
- Building Performance Training
 - Current and prospective building professionals
 - Helps workers thrive in an evolving industry
- Home Energy Savings
 - Homeowners and renters
 - Improves home comfort and safety
- [Upcoming Courses](#)

Purpose of Today's Workshop

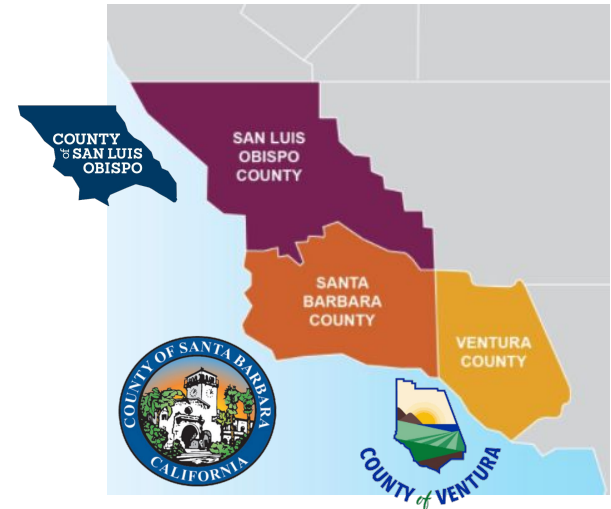

TRI-COUNTY REGIONAL ENERGY NETWORK
SAN LUIS OBISPO • SANTA BARBARA • VENTURA

Help cannabis producers improve the efficiency of their operations with environmental control systems

Convey scientific insights directly to producers and finding the best ways to translate them in the context of a local ecosystem

Help government agencies and energy efficiency programs achieve their climate goals through knowledge sharing

Encourage cultivators to take advantage of 3C-REN resources to support compliance with County energy conservation plans

Access Your Tri-County Virtual Classroom

Access the virtual classroom to continue learning

Free guidance on efficient cannabis cultivation

All live workshops are available for on-demand viewing!

- Recordings of live workshops
- Tip Clips
- Downloadable resources
- 3C-REN tools

Best practices on energy, water efficiency, and productivity

Efficient Cannabis Cultivation to Increase Profit & Productivity

The Tri-County Regional Energy Network (3C-REN) and Resource Innovation Institute (RII) are partnering to bring a 4-part workshop series and virtual classroom to cannabis cultivation operations in San Luis Obispo, Ventura & Santa Barbara Counties. This training & education is free to regional producers and features vetted subject matter experts from RII's Technical Advisory Council.

Register for the Workshop Series

CONTROLS & AUTOMATION IN GREENHOUSES

Managing Energy with Controls

Sources of Energy Use

Cultivation operations may use:

Electricity

- Electricity for horticultural lighting
- Electricity for HVAC processes
- Electricity for motors:
 - Pumping water
 - Actuating greenhouse vents
 - Running fans

Fuel (natural gas, propane)

- Fuel for heating processes
- Fuel for combined heat and power (CHP)

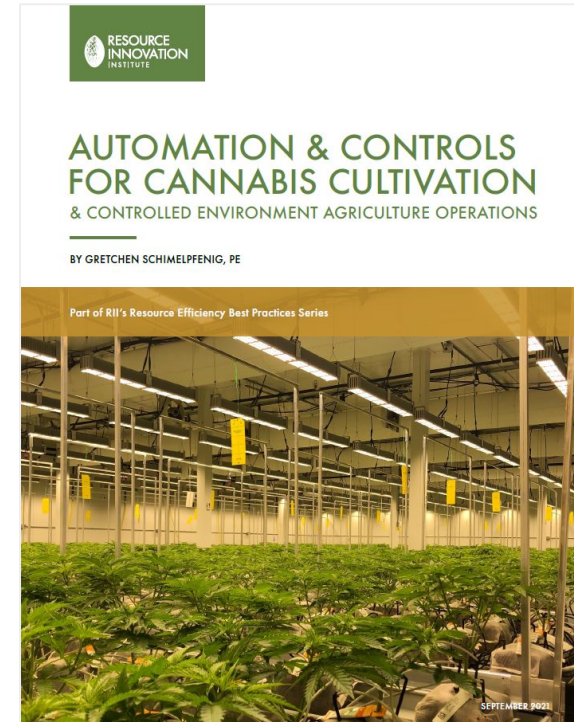

Download the Controls Best Practices Guide

Brand-agnostic information for producers

Free guidance on lighting, HVAC, and water controls

- Speak the language relevant to controlling and automating environmental control systems in horticultural applications
- Understand types of control systems optimizing horticultural environments
- Plan for integrated controls approaches in greenhouses and indoor operations
- Install and operating successful controls solutions in alignment with business models
- Use data from control systems to improve productivity and efficiency
- Demonstrate energy savings for utility energy efficiency incentive programs

DOWNLOAD NOW

Start Your Journey to Automation

Design Conditions vs. Target Conditions

- Optimize for producing for the entire year
 - Consistent yields
 - Verifiable results

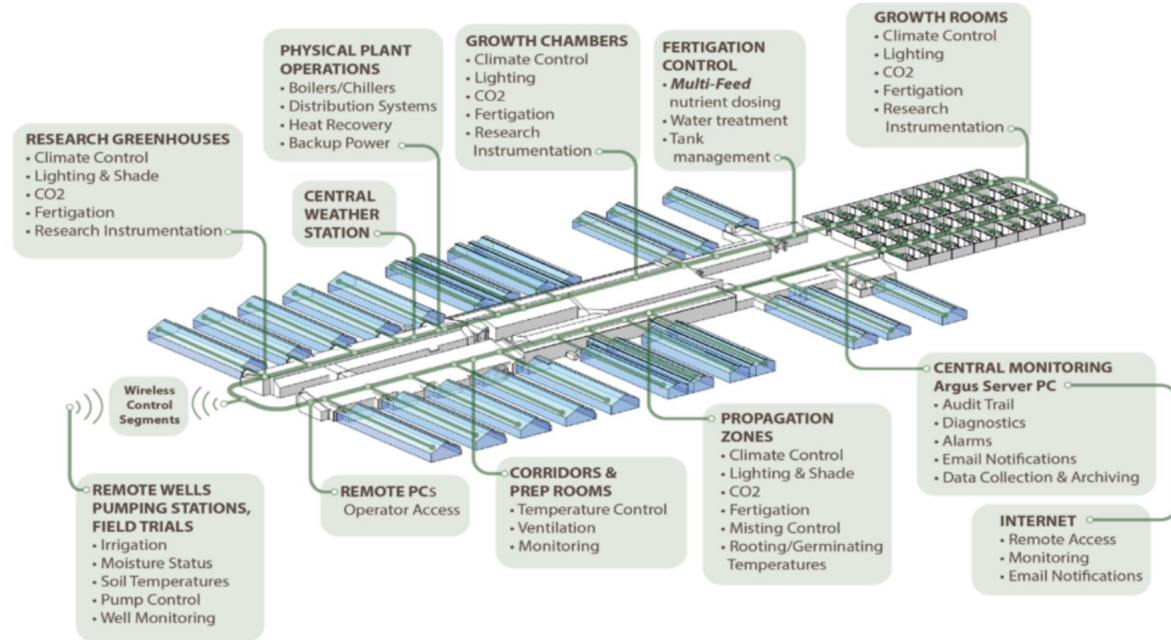

Controls Considerations

- Wired vs wireless control systems
- Sensor placement
- Point of control
- Resolution & accuracy
- Integration
- Maintenance & end of life planning

Fully Integrated Controls

- **Feedback**
 - Reacting to a change
- **Feed forward (integrated)**
 - Acting preemptively and predictively
- **Integration benefits**
 - Reduce wear and tear
 - Improve control
 - Save energy
 - Save water
 - Real time data for troubleshooting

Benefits of Commissioning

Ensure Mission-Critical Systems Perform Optimally

- Improve maintenance procedures
- Save staff time
- Reduce operations & maintenance expenses
- Save energy: 3% and 12% for industrial facilities
- Verify systems respond as expected
- Validate resource efficiency
- Resolve problems before product at risk
- Avoid expensive fixes requiring shutdowns in operation

CANNABIS
BUSINESS TIMES

**Reduce Expenses by
Commissioning Your Cannabis
Facility**

READ MORE

Design-Phase Commissioning

Third-Party Review of Project Design Docs

- Review Owner's Project Requirements (OPR) including target setpoints, standard operating procedures, failure conditions
- Assist design team with creating Basis of Design (BOD)
- Develop a commissioning plan
- Perform design review of drawings
- Review equipment submittals
- Identify issues & suggest adjustments

Design-Phase Commissioning

Early Engagement to Plan Controls

- Design for annual production
 - All seasons and consistent production
- Analyze supplemental lighting needs
- Understand interactive effects on systems:
 - Power
 - HVAC and humidity management
 - Water
- Plan your controls system responses to conditions outside of target ranges

	Average Daily DLI	Delivered Avg DLI	Required DLI
Month	Hagerstown, MD		
January	14.6	10.22	36.78
February	20.6	14.42	32.58

Construction-Phase Commissioning

Performance Testing to Validate Controls

- Multistage process involving several project team members:
 - Construction manager
 - Controls contractor
 - Commissioning agent
- Create prefunctional checklists and functional performance tests and work with controls contractors to witness and record all functional tests
- Identify issues in the field and issue reports recommending resolutions
- Create staff training agendas
- Produce a final commissioning report
- Ensure that Contractors have provided operations and maintenance (O&M) manuals

SECTION 05

BUILDING ENVELOPE & SHADING DEVICES

Greenhouse Climate Control Approaches

Passive Climate Control

Ventilated greenhouses can use low-energy solutions like roof vents to release hot, humid air.

Passive solutions can manage climatic conditions in greenhouses, but actual environmental conditions can range widely.

Active Climate Control

Ventilated greenhouses can be actively ventilated using ventilation fans to cool and dehumidify growing spaces.

Well-sealed greenhouses can achieve target environmental conditions by using fans, evaporative cooling walls, refrigerant-based cooling and dehumidification equipment, and mechanical heating systems.

Greenhouse Envelope

Ventilated greenhouses use plastic or glass coverings which are hard to completely seal.

Greenhouses with insulated and tightly sealed envelopes can more actively control climate and achieve target environmental conditions.

Different Greenhouse Techniques

Ventilated Greenhouses

- Can utilize building envelope for HVAC & dehumidification
- Can use ventilation to control temperature and humidity
- Might use mechanical climate control equipment

Sealed Greenhouses

- Hybrid building envelope of opaque and transparent walls
- Well-insulated and tightly sealed envelope
- Must use mechanical climate control equipment

Upcoming Greenhouse Code Changes

Read the [Final CASE Report](#)

Greenhouse Envelope Standards

- *Opaque* walls and opaque roof assemblies must meet the existing mandatory insulation requirements in Section 120.7.
- *Non-opaque* wall assemblies must have a combined **U-factor of 0.7** or less
- *Non-opaque* roof assemblies must have a combined **U-factor of 0.7** or less
- Exempts greenhouses from existing prescriptive building envelope requirements for window wall ratio, skylight roof ratio, and daylighting requirements for large enclosed spaces
- Applies to:
 - Newly constructed greenhouses and to greenhouses being converted from unconditioned to conditioned
 - Additions to conditioned greenhouses

Greenhouse Envelope Performance

Read the [Final
CASE Report](#)

Insulation

- Greenhouse buildings are constructed in many different ways, and to describe them, it is useful to understand some building system terms.
- Thermal envelopes are sometimes referred to as a building's skin, or shell; you can think of them like your greenhouse's coat in the winter and sunscreen in the summer. Weatherization describes activities you can do to improve thermal envelopes.
- Weatherization activities include insulating , which minimize unwanted heat losses and gains, and air sealing, which reduces the infiltration of outside air.
- Insulation is rated using R-value (a higher value is better) or the U-value (the inverse of R-value, where a lower value is better).

Greenhouse Envelope Performance

Greenhouse Coverings

- Popular covering types include rigid plastic, film plastic, and glass
- Each can vary in cost, durability, light transmission, and insulation
- Insulative qualities depend on the type and the thickness
- Rigid plastic products like polycarbonate, acrylic, and fiberglass are popular as they can feature multiple layers of walls which trap air for lower U-value
 - Single wall polycarbonate will not comply
- Film plastic is attractive due to its low cost, but provides no insulation
 - Will not comply without double layers of film and an air gap
- Glass has varying insulation ratings
 - Single pane will not comply

Read the [Final
CASE Report](#)

Greenhouse Envelope Performance

Insulative Qualities of Coverings

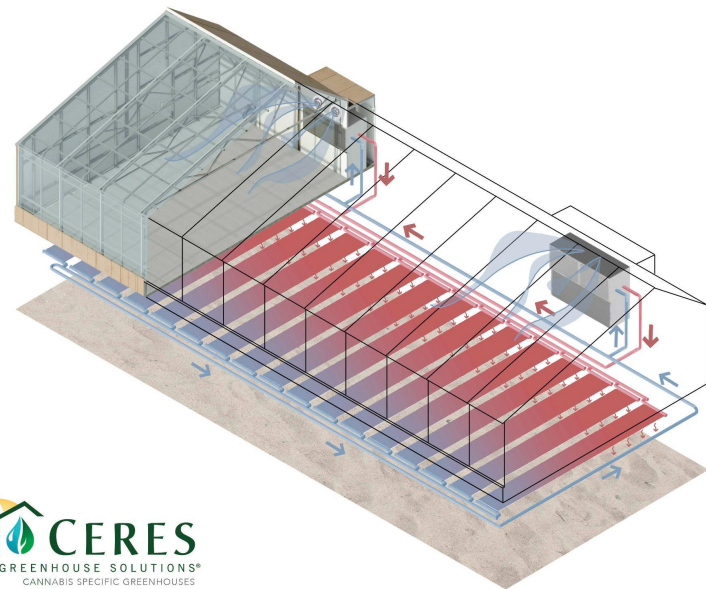

Covering Type	U-Factor	Cost / Square Foot (\$USD/sf)	Useful Life (Years)
Polycarbonate, Five Wall, 25 mm	0.31	\$8.00	10 -15
Polycarbonate, Triple Wall, 8 mm	0.50	\$4.00	10 -15
Double-Pane Storm Windows	0.50	\$6.00	25+
Polyethylene film, Double, with IR	0.50	\$0.25	3 - 4
Polycarbonate, Double Wall, 10 mm	0.53	\$2.50	15
Acrylic, Double	0.56	\$2.66	30+
Polycarbonate, Double Wall, 6 mm	0.65	\$1.54	10 -15
Polycarbonate, Double Wall, 4 mm	0.70	\$1.50	10 -15
Glass, Double Pane	0.70	\$6.00	25+
Polyethylene film, Double	0.70	\$0.18	3 -4

Sealed Greenhouses

Finely Tuned Environmental Conditions

- Sealed greenhouses are more capable of achieving target environmental conditions because they are **less sensitive to ambient conditions** due to less outdoor air infiltration and have **better thermal performance** than ventilated greenhouses.
- Cultivars in traditional greenhouses experience wide temperature variation across cultivation spaces:
 - +/- 10 degrees F variance from target temperatures and +/- 10% from the target RH
 - +/- 7 degrees F temperature differences between the intake and fan (exhaust) ends of the same greenhouse bay

TIP CLIP:

Building Envelope:
Sealing & Insulating

Ceres Greenhouse
Solutions

WATCH

External & Internal Equipment

External Building Envelope: Vents

- Materials selection has huge impact on building performance
 - Finding the best ratio of insulation to glazing
- Natural ventilation to allow heat to escape and fresh air inside

Internal Building Envelope: Thermal Curtains

- Insulation and management of solar conditions

Fans

- Active ventilation & circulation to optimize airflow

Cooling & Heating

- Active processes to reduce or increase temperature

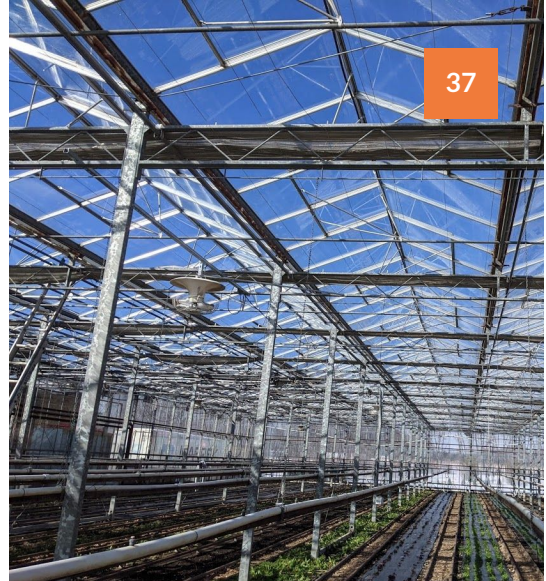

External Building Envelope: Vents

Ridge Vents

- Hot air inside the greenhouse escapes through roof opening
- Manually operated or automatically controlled

Side Wall Curtains

- Rigid plastic rolled up via crank, or opens from the top and drops down
- Manually operated

External Building Envelope: Vents

Side Wall Vents

- Rigid vents operated via rack and pinion systems
- Covered with rigid or film plastic for longer life
- 2 - 3X more expensive than side wall curtains
- Provide a much tighter seal to hold in heat
- Manually operated or automated

Shade and Thermal Curtains

Climate Curtains

- Some curtains both shade and insulate, some do one or the other
 - Open-weave curtains may not insulate
 - Transparent thermal curtains may not shade
- Screens can:
 - Manage solar radiation
 - Reduce heat loss at night and in colder months
 - Protect plants on sunny and hot days
 - Save energy on both heating and cooling
 - Reduce utility bills
- Manually operated or automatically controlled

Right Climate for Growth

The Right Climate for Growth

A better climate for every crop

Light

Temperature

Energy

Optimizing these factors is key to achieving growing goals.

Climate screens allow you to effortlessly control your crops climate, from managing light to temperature, you can enjoy the benefits of complete climate control:

Lower energy costs

Less risk of disease

Higher-quality crop

Higher yields

Faster Production

Optimal temperature

Lighting Efficacy and Controls

Greenhouse Growing, Horticultural Lighting

In a building with CEH spaces and with more than 40 kW of aggregate horticultural lighting load, the electric lighting systems used for plant growth and plant maintenance shall meet the following requirements:

1. Luminaires shall have a photosynthetic photon efficacy of at least **1.7 micromoles per joule** rated in accordance with ANSI / ASABE S640 for wavelengths from 400 to 700 nanometers.
2. Time-switch lighting controls shall be installed and comply with [Section 110.9\(b\)1](#), [Section 130.4\(a\)4](#), and applicable sections of [NA7.6.2](#).
3. Multilevel lighting controls shall be installed and comply with [Section 130.1\(b\)](#).

Designing Lighting Controls Systems

Planning Lighting Controls

- Facility location
- Crop being grown
- Growing seasons
- Cost vs. performance
- Perpetual harvest
- Maximizing production
- Balancing efficiency

Provide plants with the exact intensity and quantity of light while minimizing energy consumption and lowering bills

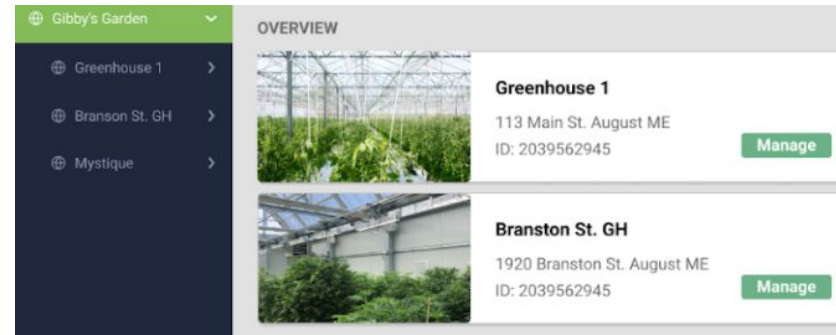

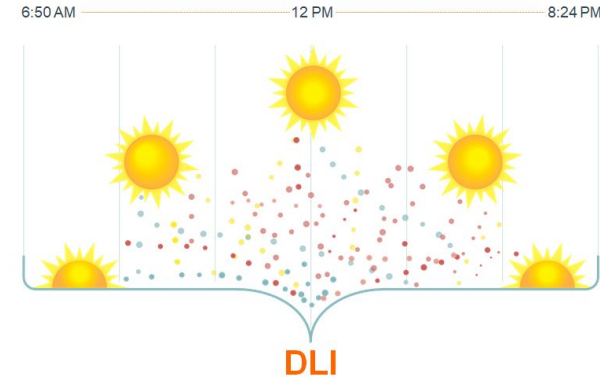

Specify Control Parameters

Target Ranges for Best Outcomes for Plants

- PPFD
- DLI

Determine the information sensors will use to modulate equipment output to meet thresholds

PPFD vs. DLI

Lighting Controls: Recipes for Cannabis Steering

Gather data to support lighting controls incentives

Table 4: Lighting Controls for Cannabis Steering by Stage of Plant Growth⁶

Lighting Controls	Vegetative	Flowering	Ranges of Controls Values
PPFD	Lower	Higher	300 - 1500+ $\mu\text{mol}/\text{m}^2/\text{s}$
DLI	Less	More	20 - 42 $\text{moles}/\text{m}^2/\text{day}$
Spectral Treatments (R:B ratio)	Higher	Lower	7 - 15%; higher blue for shorter plants
Far Red Treatments	More	Less	Used to manage shade avoidance

Systems to Control: Lighting

Sensors and their integration

- New construction or existing
- Wireless vs. wired
- Determine zones
- Controlling vs monitoring
- Key points to monitor

Lighting Controls Strategies

Scheduling

- Adjust photoperiod

Dimming

- Modulate light intensity by zone of control
 - Daily
 - By stage of plant growth

Spectral Tuning

- Modulate photon output from wavelength ranges

Understand energy savings potential of strategies and data needed to validate performance

Table 3: Lighting Controls Parameters Measured by Cannabis Cultivators

Lighting Data Collected ⁵	Percentage of Growers Collecting, 2020
Light intensity (PPFD)	55%
Spectral quality	33%

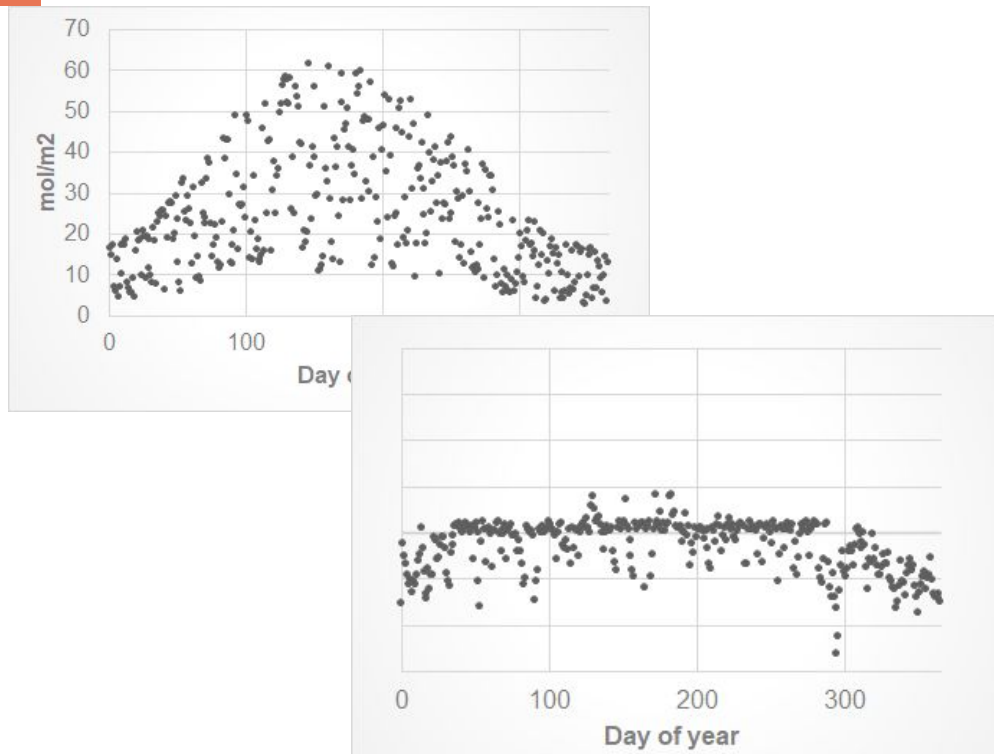

Dimming Controls to Meet DLI Targets

Daylighting Controls for Greenhouses

- Dimming
 - Thresholds
 - Response rates

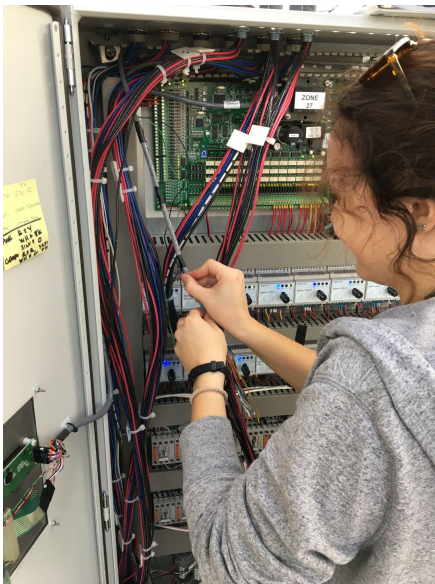

Maintain light levels to the canopy

Avoid under-lighting or over-lighting

Energy Savings from DLI Controls

Academic greenhouse observed 30% energy savings from using controllers to operate lights off sunlight intensity compared to operating off timers

Feed-Forward Controls for Lighting

Lighting Benefits from Predictive Controls

- Predictive controls and cost-effectiveness
 - Weather
 - Peak demand
 - Shade control integration
 - Photoperiods
 - DLI

Map Your Controls and Responses

- Zones
- Dimming
- Response rates
- Ambient conditions and interactive effects

Commissioning Lighting Controls

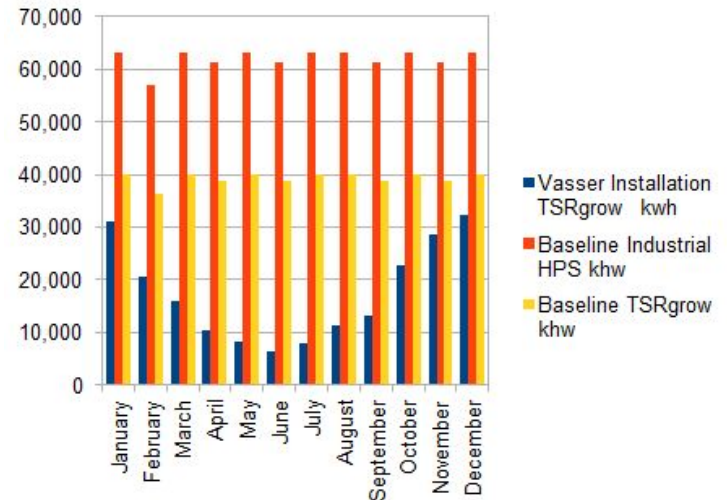

Advanced Lighting Systems

- Verification of installation
- Remote monitoring
- Integrated startup and commissioning
- Reporting and metrics and verification

Target Setpoints

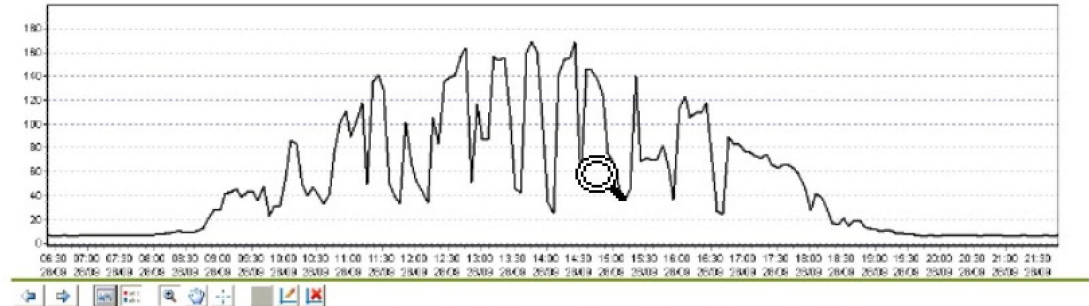

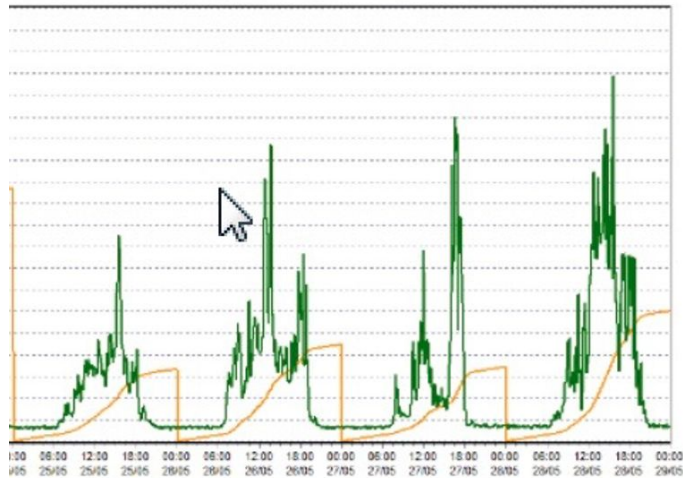

- Zones
- Ranges
- Choosing control values
- Set points that are sustainable year round

Power Savings TSRgrow Flower in Vassar
Installation vs. Baseline

Tweaking Lighting Response Rates

Applying a data filter to light sensors reducing cycling of equipment

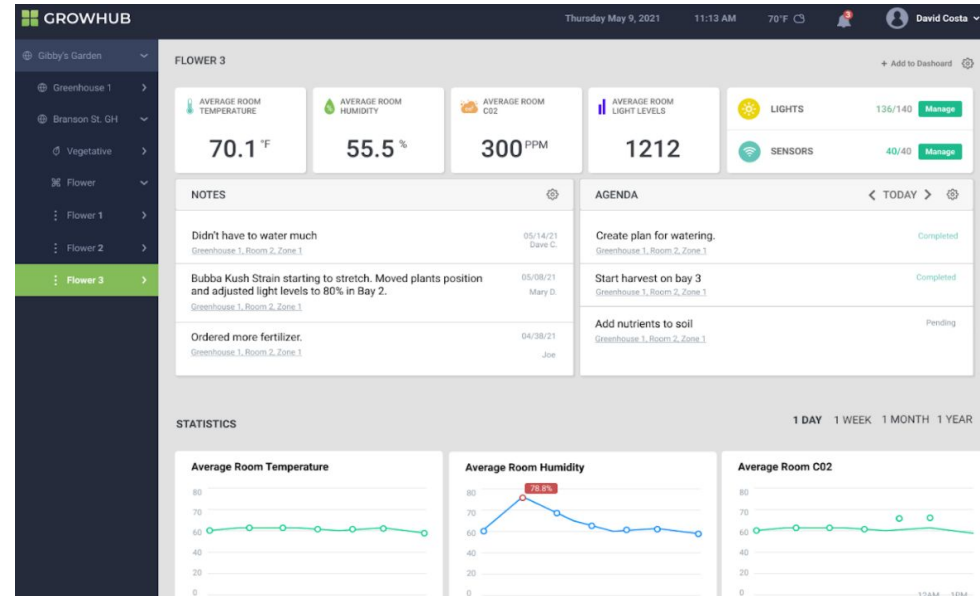

Lighting and Environmental Controls

Lighting Interactive Effects

- Ambient conditions can affect demand for lighting (schedule and intensity)
 - Greenhouses have dynamic temperature, humidity, CO₂

Systems Affected by Lighting

- HVAC and humidity management
- Fertigation
- Curtain controls

Mechanical Cooling Equipment

Cooling

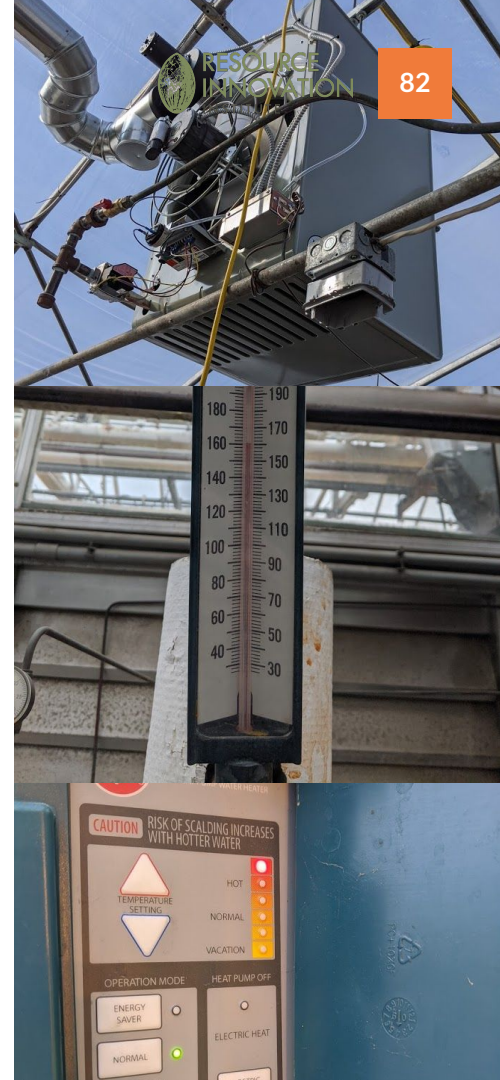

- Cooling equipment to maintain target environmental setpoints
 - Evaporative systems:
 - Pads and fans (P&F)
 - High-pressure fog (HPF)
 - Refrigerant-based cooling systems
 - Direct expansion (DX)
 - Heat pump equipment
- Often automatically controlled
 - Can be staged on after passive ventilation strategies

Mechanical Heating Equipment

Heating

- Radiant systems to maintain target environmental setpoints
 - Associated pumps
- Unit heaters
- Heat pump equipment
- Sizing heating equipment for CEA
 - Winter / night conditions
 - Depend on cultivar
 - Affected by supplemental lighting
 - Determine design conditions for winter / night
- Temperature controls for hydronic and ducted systems

Climate & Airflow Controls

Climate & Airflow

- Mapping your facility
- Use the environment to your advantage
 - Consider advanced in-ground designs for heat capture/re-use/recirculation and cooling

Monitor and Measure to Control

- Sensors throughout facility
 - At all levels and in the ground
- Feed-forward predictive control
 - Reacts to environmental influences before they are reported by sensors

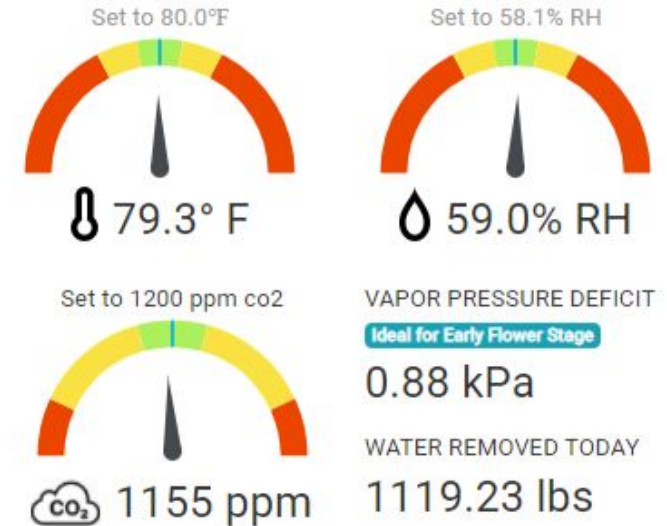

HVAC Controls: Interactive Effects

Respond to light and water

- Orchestrate your envelope HVAC controls to call and respond to daily and seasonal solar variation and your supplemental lighting controls
- When the sun sets, humidity spikes, and control strategies give envelope and HVAC equipment more time to ramp up and respond
- Likewise, plant stage of growth and timing of watering events can demand more of your HVAC system

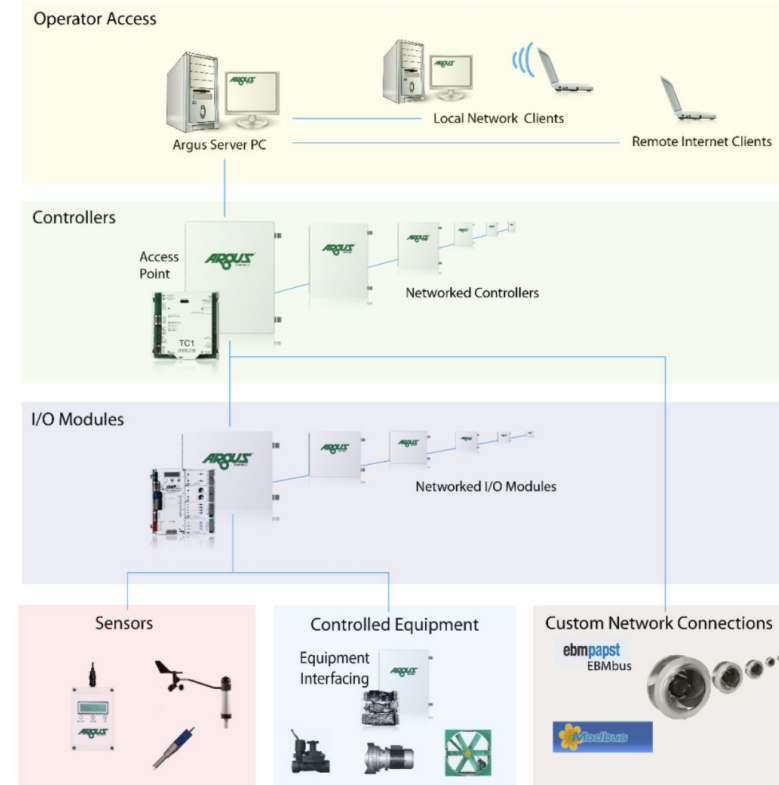

HVAC equipment should monitor both lighting and irrigation controls activities for faster response times and happier plants

Integrated Greenhouse Controls

Intelligent Cooling with Feed-Forward Controls

- Feedback alone can cause poor control and wasted energy
- Using feed-forward integrated controls, HVAC controls can preemptively anticipate weather conditions to improve control and save energy.
- Hardware communicates with software to inform systems of actual conditions in the greenhouse
- Environmental controls orchestrate which system should respond:
 - Vents, curtains, fans, active cooling

HVAC Controls: VPD Controls

Maintain efficient VPD targets

- There is not a target VPD that is appropriate for all cultivars, environments, or cultivation methods
- Consider acceptable VPD ranges by stage of plant growth

Dial in HVAC system automation to tailor VPD to specific cultivars, systems, and facility configurations

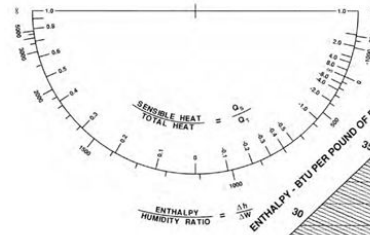

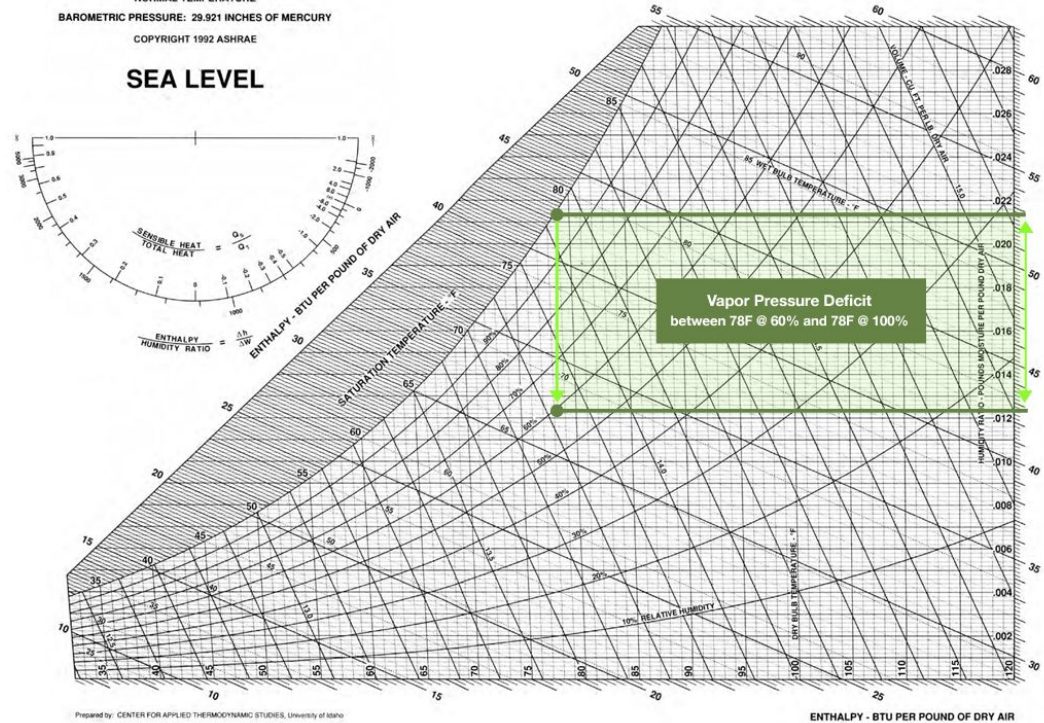

Figure 2: VPD - The Differential Between Grow Room and Leaf Conditions

Maintaining Airflow

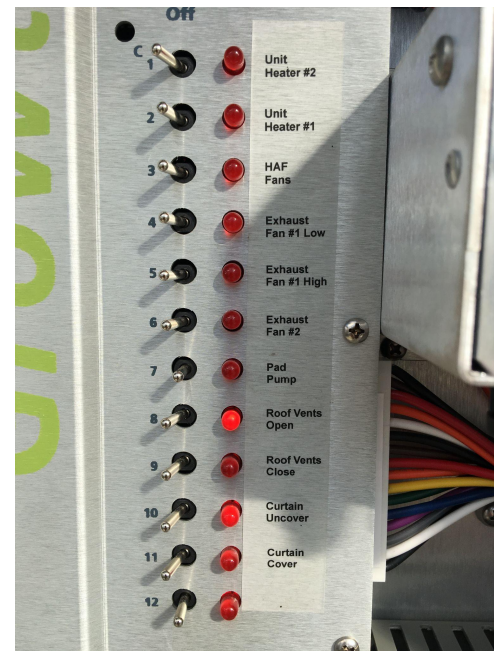

Ventilation & Circulation Fans

- Using both leeward and windward vents can allow for smaller openings
 - Leeward to reduce temperatures and remove excess humidity
 - Windward vents can create greater air movement above thermal curtains
- Size ventilation fans properly for your airflow requirements:
 - For hot season growing use 8 CFM per square foot of growing space
 - For cooler season growing use 2 CFM per square foot
- Install circulation fans to satisfy flow rates of 25% of your greenhouse's volume per minute

Plant Empowerment Concepts for Cannabis

1. Control radiation with thermal curtains
 - a. Close energy screens to limit heat emission from plants at night
 - b. Open energy screens later in AM and close earlier in PM
2. Determine what equipment serves what purpose
 - a. Circulate and ventilate to actively maintain airflow
 - b. Improve humidity control with HVACD equipment
3. Document target environmental conditions
 - a. Select targets to maintain plant balances
4. Operate HVAC equipment to maintain a uniform climate
 - a. Stage equipment to achieve target environmental conditions
5. Monitor VPD, lighting system operation, and energy flows
6. Base irrigation on total energy flows and VPD monitoring

Commissioning Environmental Controls

Monitoring

- You can't manage what you don't measure...but you can't measure what you don't monitor
- Make data to support savings claims

Calibration

- Ensure sensor accuracy so HVAC systems respond to actual environmental conditions
- Configure response times to reduce short-cycling

Commissioning

- Functionally test HVAC sequences of operation to ensure persistent energy savings

Articles co-authored by RII with members of our Technical Advisory Council Working Groups

A low-angle shot looking up at the complex metal framework of a greenhouse. The structure is composed of numerous intersecting steel beams and supports. In the background, rows of green plants are visible, growing in a structured manner. The lighting is somewhat dim, with a blueish tint, suggesting an overcast day or the interior lighting of the greenhouse.

SECTION 06

EFFICIENCY PROGRAM EXAMPLES

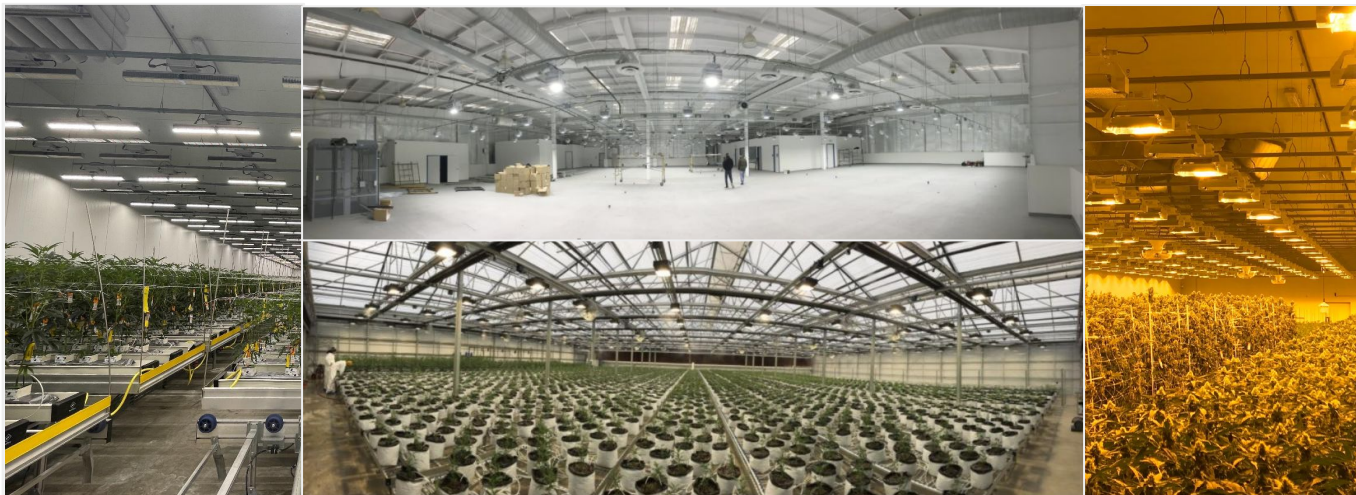

Efficiency Utilities Serving Tri-County

Three Regional Utilities with Efficiency Programs

- Utility service territories determine eligibility
- Growers in Tri-County region can benefit from technical assistance and financial incentives
- Incentives reduce the first cost of high-performance technology

Cannabis Efficiency Project Landscape

Read customer testimonials at

<https://www.socalgas.com/for-your-business/energy-savings/rebate-and-incentive-testimonials>

SoCalGas Programs for Producers

Energy Efficiency Programs

- **Agriculture Energy Efficiency Program (AgEE)**
 - New program implemented by ICF, EnSave, and ERI Pacific
 - Financial incentives of up to 50% of the project cost
 - Projects must be installed by the end of 2023
 - Incentives for some projects are available back to June 7th, 2021
 - SoCalGas customers can contact Karl from EnSave at karlj@ensave.com
 - Send general program emails to AgEE@CAEnergyPrograms.com
 - Call 844-523-9981

Visit <https://caenergyprograms.com/AgEE>

SoCalGas Greenhouse Customer Incentive Examples

Project 1:

Sunnyland Nurseries - Greenhouse

Energy management system

- Saves energy by monitoring climatic changes and automatically adjusting setpoints inside greenhouse
- “Does a better job than I did,” notes owner Robert Akashi

Energy Saving Results

4,800 therms per year

Incentives \$3,850

Project 2:

Skyline Flowers - Greenhouse

Infrared film

- Saves energy by reducing thermal cooling at night
- “If you’re aware of the program and know what it offers, the rebates can be substantial for agriculture businesses”

Energy Saving Results

20,000 therms per year

Incentive \$25,000

SoCalGas AgEE Program Offerings for CEA Customers

Energy Efficient Equipment Incentives

- Heat curtains / energy screens: \$0.35 - \$0.50 per sq. ft.
- Infrared (IR) film: \$0.045 - \$0.10 per sq. ft.
- Condensing boilers: \$6.00 - \$10.00 per rated kBtu capacity
- Pipe insulation: \$2.50 - \$4.00 per linear foot
- Custom projects: \$2.50 - \$3.00 per first-year therm saved

Other Program Offerings

- Free technical assistance to identify and prioritize greenhouse energy efficiency projects
- Energy audits and facility walkthroughs for large customers
- Direct installation of select measures at low/no cost for growers in disadvantaged communities
- Zero-percent on-bill financing up to \$100,000 per meter

All SoCalGas customers qualify for participation. Contact EnSave for more information!

A photograph of a large-scale indoor cannabis cultivation facility. The image shows rows of green cannabis plants growing in a greenhouse-like structure with a complex metal frame and glass panels. The plants are supported by a white mesh netting system. The lighting is bright, and the overall atmosphere is industrial and controlled. The text "Q & A" is overlaid in the center of the image.
