

# Energy & Water Efficiency in Controlled Cannabis Cultivation

NYSERDA

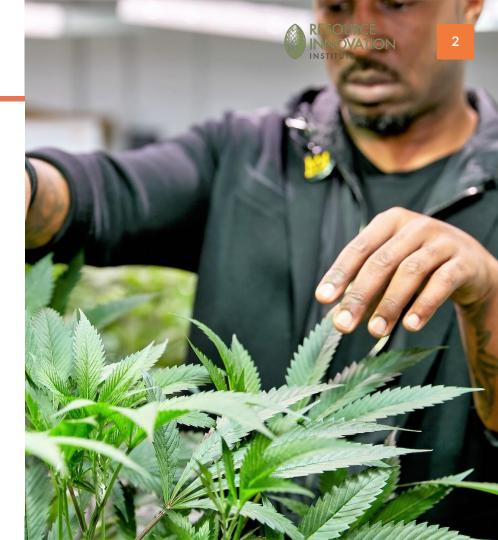

Office of Cannabis Management

May 9, 2023

## Agenda

Introduction & Purpose
Cannabis Science 101, part I
Lighting Considerations
Shade & Thermal Curtains
Water Quality & Sources
Resources
Q&A

#### **About RII**

- Objective, data-driven, non-profit organization. USDA-funded.
- > Founded 2016 in Portland, Oregon
- Form working groups from industry, government and academia to develop Best Practices Guides
- ➤ Webinars, workshops, articles for industry
- Benchmark growers production and resource efficiency with our Powerscore Platform

#### **Our Network**

**EDUCATION** and advocacy about best practices for growers

## **RII Industry Working Groups**

- Guides development of standards and climate-smart methodology
- Shapes tools and resources to support Best Practices Guides
- Advocates for informed policies, incentives and regulations

Equipment/Service providers: Become a Member!

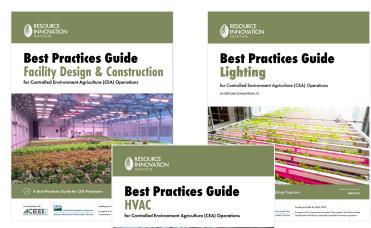

#### **Free Best Practices Guides**

#### **Collaboration by Industry Experts**

Free guidance on efficient cultivation

- CEA Facility Design & Construction Best Practices, 2022
- <u>CEA HVAC Best Practices</u>, 2022
- <u>Cannabis HVAC Best Practices</u>, 2019
- CEA Lighting Best Practices, 2022
- <u>Cannabis Lighting Best Practices</u>, 2019

## **Purpose of Today's Workshop**

Help NY cannabis growers improve energy and water efficiency in greenhouse and indoor facilities

Convey scientific insights and industry expertise directly to producers and find the best ways to translate them in the context of their locality

Assist cannabis producers and their design and construction project partners, with what they need to know to stay competitive and comply with regulations

## **Today's Experts**

**Rob Eddy** 

**Jason Matlock** 

**Paul Arena** 

**Dane Sheldon** 

#### **Access Your New York Virtual Classroom**

#### **Continue Learning Online**

Free guidance on efficient cultivation

All live workshops are available for on-demand viewing!

- Recordings of live workshops
- Downloadable resources
- NY State program tools

# **POLL ALERT!**What kind of facility are you

- Small indoor building
- Warehouse

cultivating in?

- Standard, vented greenhouse
- Sealed, air-conditioned greenhouse
- Container farms or pods

Botanically, Cannabis sativa is a dioecious flowering plant with three species subtypes:

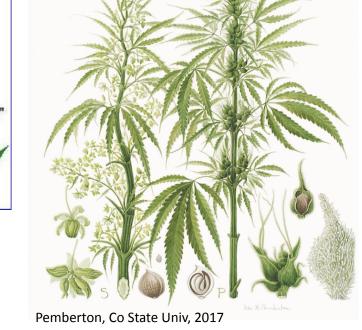

sativa, indica and ruderalis

Noteworthy genetics:

- -Production of secondary metabolites
- -Production of lignin and cellulose
- -Response to light

McPartland, 2018

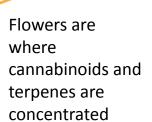

**TABLE 1** 

| Development Stage                  | Propagation   |              |                 |                              |                              |                             |                              |  |
|------------------------------------|---|--------------|-----------------|------------------------------|------------------------------|-----------------------------|------------------------------|--|
|                                    | Tissue<br>Culture   |              | eed             | Cutting                      |                              | Vegetative                  | Flowering                    |  |
|                                    | Fixed   | Fixed        | Photoacclimated | Fixed                        | Photoacclimated              |                             |                              |  |
| Light intensity (umols/m²/s)       | 60-80   | 150-250      | 150-350*        | 150-250                      | 150 -350*                    | 300-600                     | 600+                         |  |

| EC (mS/cm)                         | Lab   | 0.3 - 0.7    | 0.3 - 0.7       | 0.3 - 0.7                    | 0.3 - 0.7                    | 1.0 - 2.0                   | 1.5 - 2.6                    |  |
| Root Zone Temperature              |   | 75°F - 78°F  | 75°F - 78°F     | 73°F - 75°F                  | 73°F - 75°F                  |                             |                              |  |
| Nutrient ppm                       | There are important mineral ratios which need to be monitored. In many cases, growers have a different fertilizer regimen per stage of crop development. This strategy works for some, but is not generally recommended. You can be successful with having a baseline fertilizer mix which follows proper mineral ratios and rely on manipulation of EC during each stage to supplement nutrition concentration. More information can be found in the Nutrient section of this guide, and the pH chart and Mulder's Chart should be referenced in particular. |              |                 |                              |                              |                             |                              |  |
| рН                                 |   |              |                 |                              |                              |                             |                              |  |

<sup>\*</sup>Temperature for germination should be gradually increased throughout the seed development stage

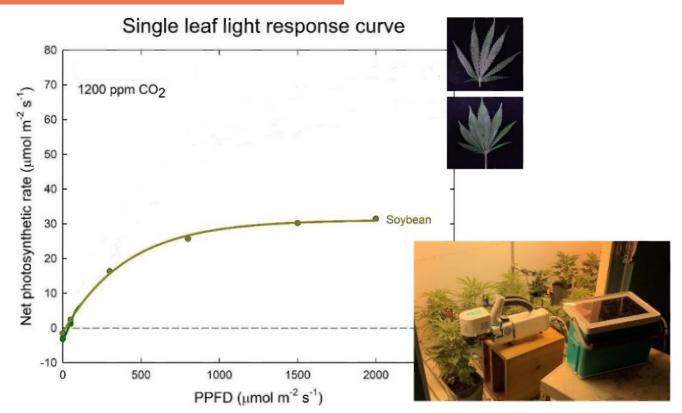

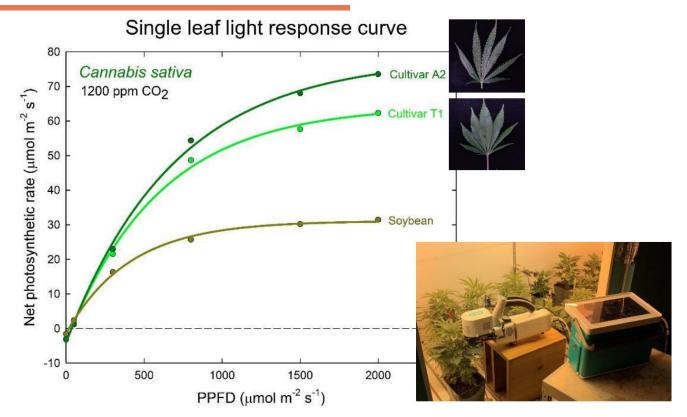

## **Light Response**

Bugbee, 2019

## RESOURCE INNOVATION

## **Light Response**

Bugbee, 2019

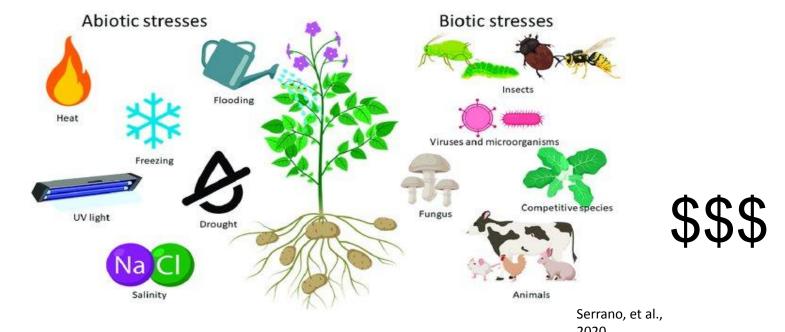

#### **Yield Follows 1% Rule**

- From vegetable industry: 1% increase light = 1% increase yield
- Change HPS, MH or fluorescent bulbs on a schedule
- Clean light reflectors, bulbs and LED diffusers if grimey or dusty
- Diffuse the sunlight in a greenhouse
- Consider intracanopy lighting for indoor grow rooms

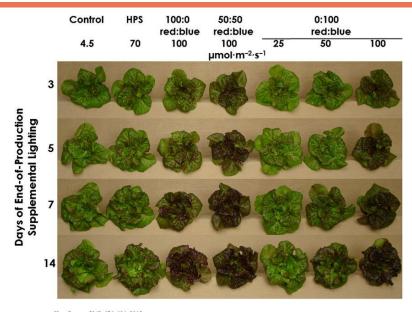

## **Secondary Metabolites**

- What are primary metabolites? (Chlorophyll, DNA, sucrose, starch, etc.)
- Secondary metabolites are defense compounds

## "Finishing Spectrums"

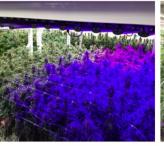

HORTSCIENCE 50(5):676-684. 2015.

End-of-production Supplemental Lighting with Red and Blue Light-emitting Diodes (LEDs) Influences Red Pigmentation of Four Lettuce Varieties

W. Garrett Owen and Roberto G. Lopez<sup>1,2</sup>
Department of Horticulture and Landscape Architecture, Purdue University,
West Lafavette, IN 47907-2010

#### MEDMEN RESEARCH & DEVELOPMENT

- Conducted during final 7 days of flower cycle
- Testing to enhance:
- Anthocyanin pigment responsible for purple coloration
- Terpenes
- 3. THC
- Preliminary results promising, conducting more trials to gather larger data set

PHOTOx SUMMIT 2017 | SAN DIEGO

## **Controlled Drought Stress & Secondary Metabolites**

HORTSCIENCE 54(5):964-969. 2019. https://doi.org/10.21273/HORTSCI13510-18

## Increasing Inflorescence Dry Weight and Cannabinoid Content in Medical Cannabis Using Controlled Drought Stress

**Deron Caplan<sup>1</sup>, Mike Dixon, and Youbin Zheng<sup>2</sup>** School of Environmental Sciences, University of Guelph, Guelph, Ontario, N1G 2W1, Canada

#### Drought Increased:

THCA concentration by 12%

CBDA concentration by 13%

THCA yield by 43%

CBDA yield by 47%

THC yield by 50%

CBD yield by 67%

One drought stress event applied on week 7 of flowering

## **POLL ALERT!**

What kind of facility are you cultivating in?

**Discuss Results** 

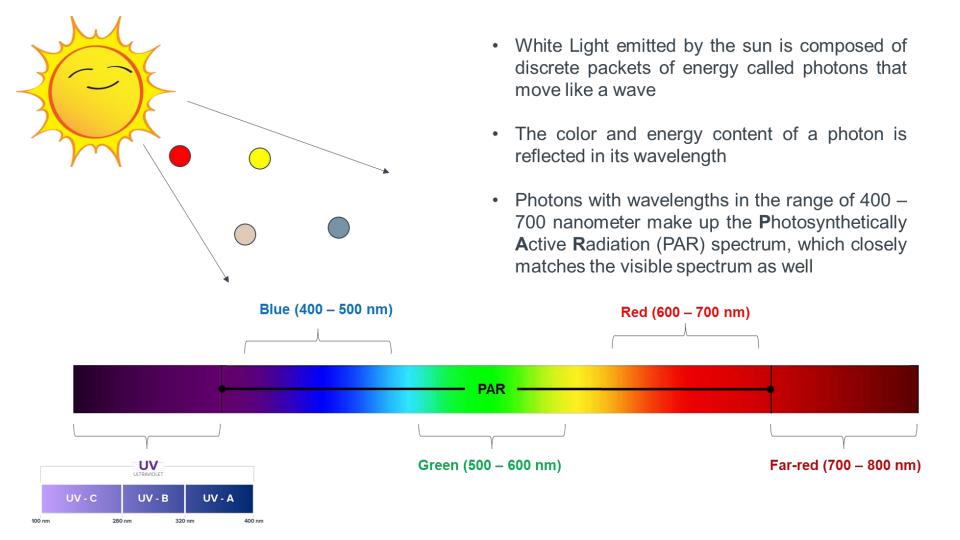

## **POLL ALERT!**

Knowledge Check: Compared to field crop production in summer, a greenhouse...

- Has about the same insect and disease problems
- Has less insect and disease problems
- Has more insect and disease problems

**(PPFD):** How Hard is it Raining?

(DLI): How Much did it Rain?

**Efficacy:** How Much Energy Used?

Quantity  $\mu$  mol·m<sup>-2</sup>·s<sup>-1</sup>  $\leftarrow$  Time (Photons) Area

Quantity mol·m<sup>-2</sup>·day<sup>-1</sup> Time (Photons) Area

Quantity (Photons) → µmol·joule<sup>-1</sup> ← Energy

0.1 0.2 - 1.0

3-5DLI50 - 80 PPFD )

 $0.80 - 1.90 \,\mu\text{mol}\cdot\text{j}^{-1}$ 

26-38 DLI 400 - 600 PPFD)

**Modern LED Lighting** 

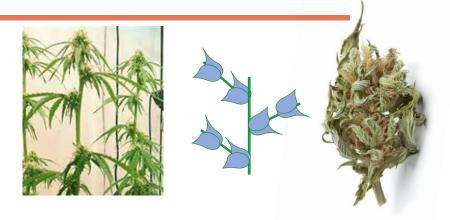

38-65 DLI 900 - 1500 PPFD )

1.90 – 3.80  $\mu$ mol·j<sup>-1</sup>

## **Light Affects Yield and Quality: Primary Economic Drivers**

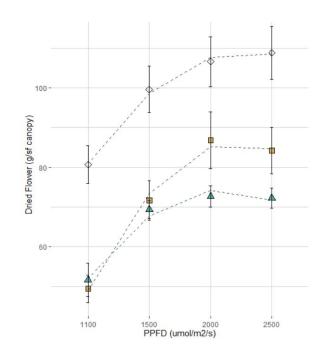

**Low Light** 

**High Light** 

No Practical Limit to Cannabis Light Tolerance under Optimized Conditions

## **Spectral Quality Affects Total Light Output**

#### Red Fraction µmol·J<sup>-1</sup>

2.7

3.0

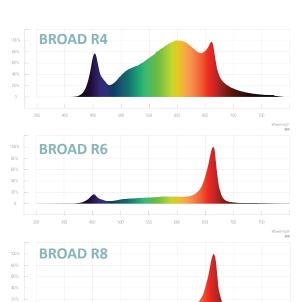

40 %

60 %

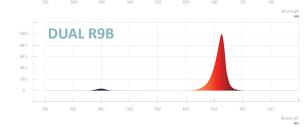

- More energy is required to produce blue photons than red photons
- A Red Shifted Spectrum will affect Fixture Efficacy
  - More light output for the same wattage
  - Less energy for the same light output

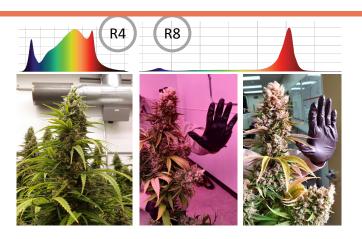

**RESOURCE** 

## **Spectral Quality Also Affects Plant Development**

Red Light DLI over 21.5 mol·m<sup>2</sup>·day-<sup>1</sup> created risk of photobleaching in Fluence Study

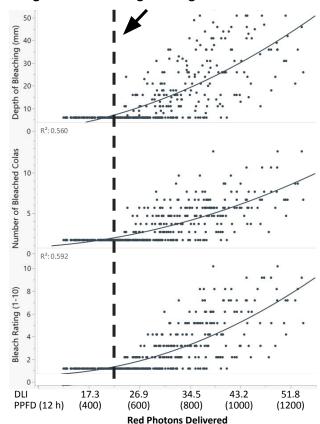

Total Photon Flux Affects Maximum Red Fraction

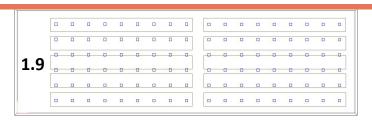

Greenhouses must account for natural light contributions

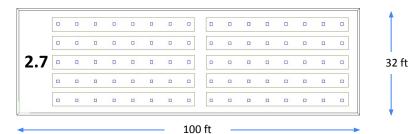

Recommend <50% Supplemental Red Light for Market Flower Production when Total Supplemental Flux exceeds 500 PPFD

## Incidence of Photobleaching under Red Gradient Light with White Light Background

## Efficient Lighting Technologies Are Part of a Holistic Approach to Greenhouse Design

| Efficacy             | PPFD                                      | DLI  | Coverage | Power<br>Density           |
|----------------------|---|--|----------|----------------------------|
| μmol·J <sup>-1</sup> | μmol·<br>m <sup>-1</sup> ·s <sup>-1</sup> | mol∙<br>m <sup>-2</sup> ·day <sup>-1</sup> | Sq. ft.  | W∙<br>Sq. Ft <sup>-1</sup> |
| 1.9                  | + 750                                     | + 32.4                                     | 20.2     | 49.5                       |
| 2.3                  | + 750                                     | + 32.4                                     | 24.3     | 41.2                       |
| 2.7                  | + 750                                     | + 32.4                                     | 27.3     | 36.6                       |

#### **Lower Power Consumption:**

- 20-40% Reduction in Electrical Use and Heat Output
- Reduced Demand for Cooling And Primary Power Decreases Project CAPEX
- · Less Heat Stress During Summer Months

#### **Fewer Fixtures for Same Light Target:**

- Lower Install Costs
  - Hanging
  - · Electrical Infrastructure
- Less Natural Light Blockage

#### **Dimming Control:**

- Reduced Peak Demand Charges
- Integration into Climate Control Systems
  - Heat Management
  - DLI Predictions
  - Photo Acclimation

Knowledge Check: Compared to field crop production in summer, a greenhouse...

- Has about the same insect and disease problems
- Has less insect and disease problems
- Has more insect and disease problems

## **POLL ALERT!**

What is your focus for the upcoming year within your cultivation practices?

- I'm just starting out!
- Saving Energy
- Temperature control
- Humidity control
- Light control

## **Benefits of Shade and Light Diffusing Screens**

- Shading screens can help control light and temperature levels, providing an overall cooler environment for both the plants, as well as the greenhouse employees.
- Diffusive white strips scatter sunlight to reach deeper and more evenly throughout the crop.
- Leads to stronger, healthier plants and accelerated production.
- Consistent bud sizes, thanks to uniform light spread

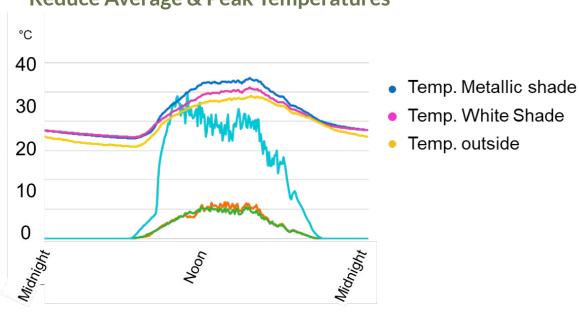

## White strips vs Aluminum strips in Shade Screens

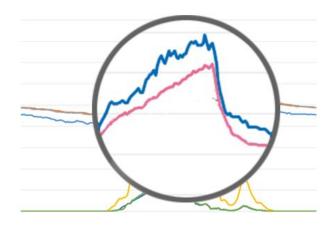

## **Every Degree Counts:**

#### Reduce Average & Peak Temperatures

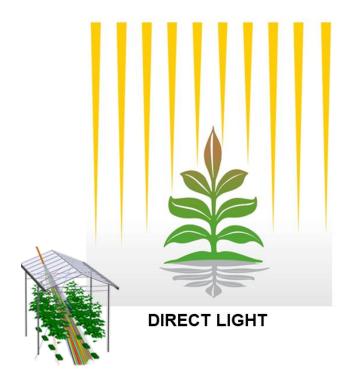

# 5°C LOWER peak temperatures!\*

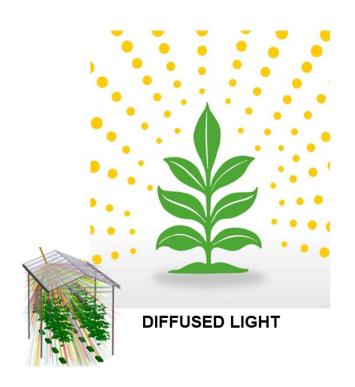

Brite Leaf Citrus Nursery, Lake Panasoffkee FL, US Average PAR and temperatures, June 2015.

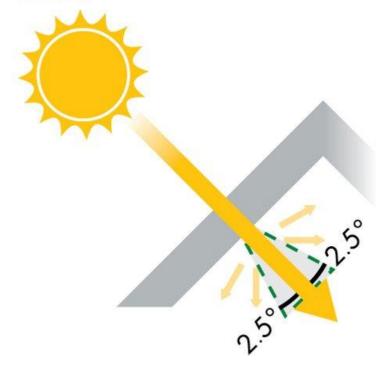

RESOURCE INNOVATION

## What is Diffused Light?

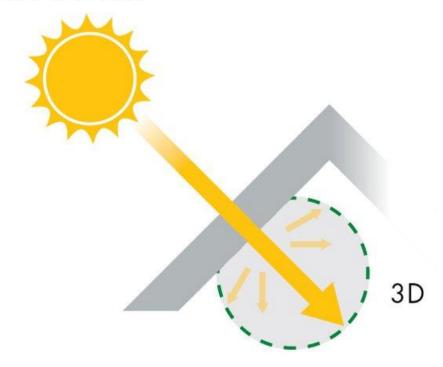

## HAZE

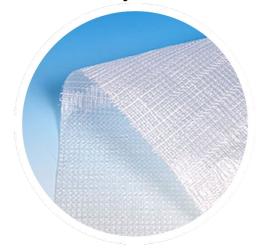

## **HORTISCATTER**

## **Equal Light Spread**

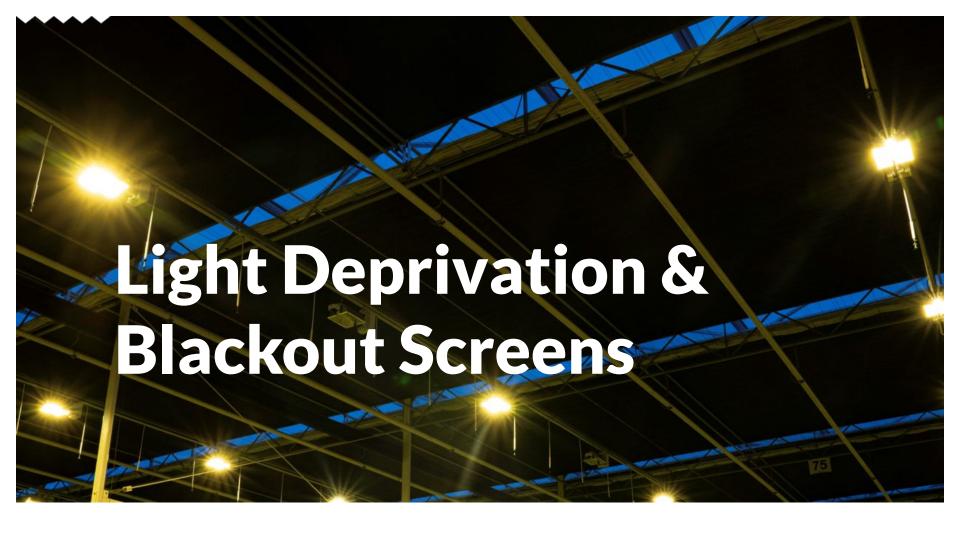

## Harmony 2047 FR

Even light diffusion decreases shadows and increases overall light in contact with the crop

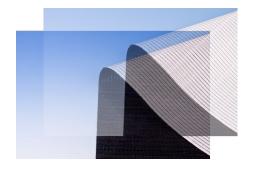

## **Light Deprivation**

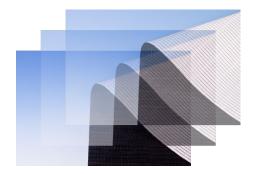

## Single, double, or triple layer blackout

Single layer
No flowering

Double layer Flowering

Triple layer Flowering

## **Layer Configurations - Twice as Versatile**

### Double and triple layer options offer complete versatility for your climate needs

Black layers **absorb and restrict**Interior light and

sunlight

Aluminum upper layer options save the most energy at night

White reflective upper layers maximize cooling in hot, sunny weather

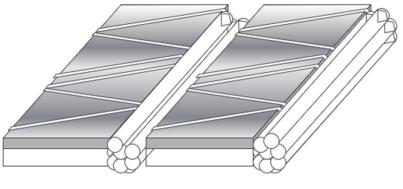

White bottom layer reflects and intensifies supplemental lighting

# Managing Humidity Under Blackout Light Deprivation Screens

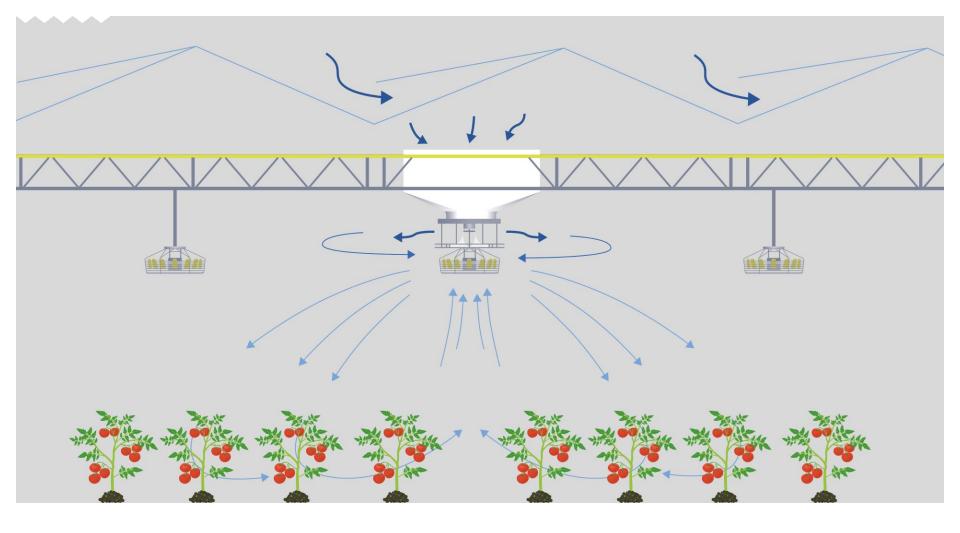

### Humidity should always be carefully managed!

- Selecting a "breathable screen" that allows water
  vapor to pass through is key for preventing moisture
  buildup and extreme spikes in humidity levels –
  minimizing plant diseases such as botrytis.
- "But I can't gap a screen that needs to stay closed to control my crop's photoperiod!"
- What other methods of dehumidification can I use to control their humidity under blackout?

humidity transport via yarns

**RESOURCE** 

## **Energy Calculator**

- Specific to each grower's operation
- A vital resource when applying for a rebate with your local utility
- Extra insight into your operational costs
- Additional insight into the specifics of your climate when requested

| Scenario names              | No Screen | Single Energy Screen | PARperfect           |
|-----------------------------|-----------|----------------------|----------------------|
| Screen 1                    |           | HARMONY_2047_FR      | OBSCURA_9950_FR_W    |

## **POLL ALERT!**

What is your focus for the upcoming year within your cultivation practices?

Discuss Results

## Knowledge Check: Some greenhouse curtains can be used for both shading in the day and retaining heat at night.

- TRUE
- FALSE

## **The Why Behind Water Efficiency**

RESOURCE INNOVATION

- Market pushing for *faster*, *cheaper*, *greener*
- In terms of water usage and pollution prevention, CEA has a leg up on traditional agricultural methods given inherent control and potential for recapture and reuse
- Only about 3% of the water on earth is fresh 0.5% is accessible
- In 2022, world population hit 8 billion people all relying on this limited resource
- In short, water is one of our most precious resources and should be conserved wherever possible

#### Objective of a Facility Water Management Strategy:

Identify opportunities to economically reduce, reuse and recycle

High level overview of considerations for optimizing water management at your facility

- Focus on the basics
  - Reliable source of irrigation feed water
  - Manage wastewater generated
  - Achieve this as efficiently as possible (cost and resource intensity)

#### Key Message:

Whether building a new facility or retrofitting an existing structure, taking the time to consider water usage, waste water generation and opportunities for recovery and / or reclamation at the outset will avoid costly modifications or missed opportunities down the line

## **Wate Jargon and Common Contaminants**

**Total Suspended Solids (TSS):** 

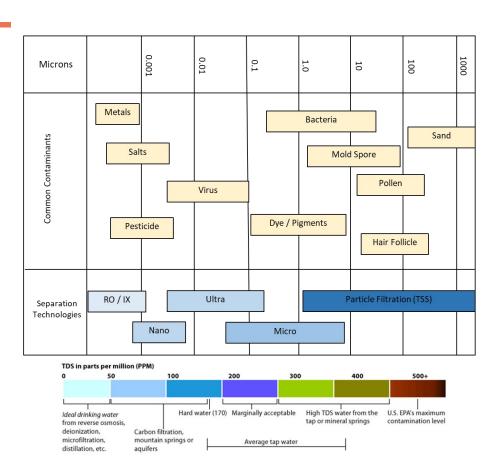

Suspended particles in water >2micron

**Total Dissolved Solids (TDS):** 

Dissolved organic and inorganic constituents present in water

Colony Forming Units (CFU):

Microbial organisms present in water

## **Irrigation Feed Water**

RESOURCE INNOVATION 5

- Require thousands to tens of thousands of gallons of water each and every day
- Quality dependent on:
  - Source (municipal, well, rain, other)
  - Location

**Key Takeaway:** 

Seasonal Variability

epa.gov/waterlabnetwork

These variables, along with cultivator preferences and staffing capabilities, should be utilized to determine the system(s) required to reliably provide desired water quality and volume

## **Considerations in System Design**

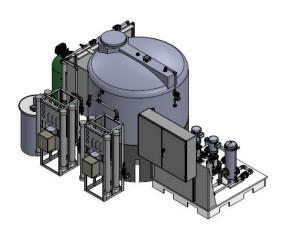

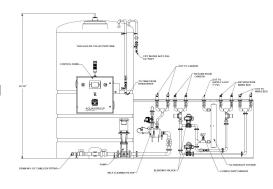

- Depending on water source reliability, on site storage may be beneficial
- Avoid stagnation in storage tanks and distribution piping as this supports microbial growth
- Size any treatment system with some margin for error and room for future growth
- If considering RO, pre-treatment and conditioning is critical to system performance and membrane longevity

Note - RO feed water temperature is critical to performance. Efficiency generally based on 70°F water

#### **Key Considerations:**

- There is no one size fits all approach to system design
- Water purification systems, if required, should be based off of quantifiable specifications
- Quality and volume specifications will drive capital and ongoing operational costs as well as PM
- Spend the time from the start as water systems can be a significant investment and ongoing cost

## RESOURCE INNOVATION

## **Wastewater Management**

- Waste Streams will be generated at your facility from the following sources:
  - HVAC condensate
  - Irrigation leachate
  - Periodic flushing / washdown / sanitizations
  - Water purification byproducts i.e. RO reject
  - Other
- Plan for management will depend on location, existing infrastructure, regulations and company objectives
- NY State's proposed regulations request plans for water efficiency and waste minimization under Environmental Plan
   Requirements described in Section 125.1

#### **Key Considerations:**

- How might I manage waste? Sewer, Surface / Ground, Collect & Haul
- What might each require? POTW effluent limits, SPDES Permit, Costs
- How may I reduce or even eliminate waste water generated at my facility through reuse and reclamation?

## **Opportunities for Reclamation**

- HVAC Condensate
  - High quality source
  - Control for pH, metals, microbial growth and volatiles picked up through air handling systems
- Irrigation Leachate
  - Interesting for reuse but more complex
  - Reuse, reclaim i.e. treat or hybrid approach
  - Control for nutrient levels / stacking, microbial growth, solids
- Process Water periodic flushes, sanitizations, washdowns)
  - Needs to be segregated
  - Do not want what is in water going back out to plants
  - Treatment required
- RO Reject
  - Concentrated waste stream with limited options for recovery distillation a potential

## RESOURCE INNOVATION

- Standard filtration (bag, depth, multi-media, backwashable)
- Microfiltration and Ultrafiltration membrane
- Removal of Dissolved Solids (TDS):
  - Ion Exchange (IX) Resins
  - Nanofiltration and Reverse Osmosis membrane
  - Distillation
- Biological Control / Disinfection:
  - Ultra, Nano or RO membrane with appropriate upfront treatment
  - UV and Ozone
- Chlorine / Chloramine / PFAS / PFOS:
  - Granular Activated Carbon aka GAC
- Evaporation / Vacuum Distillation:
  - o Important tool for waste streams not suitable for other technologies
  - Vacuum distillation far more attractive from efficiency and sustainability perspective

## **Summary**

RESOURCE INNOVATION INSTITUTE

- No one size fits all approach
- Allocate time / resources at the outset to set yourself up for success
- Sustainable water practices can also be commercially advantageous
- Water systems do require oversight and preventative maintenance
- Consider in-house capability and partner with a company that provides ongoing service and support
- In addition to capital cost, discuss and consider ongoing operational costs and required maintenance
- Don't violate the KISS principle
  - Quality
  - Reliability
  - Efficiency (capital and resource)

## Knowledge Check: Some greenhouse curtains can be used for both shading in the day and retaining heat at night.

- TRUE
- FALSE

## **Start Collecting Data: Benchmarking**

Get Verified 💿

#### Calculated PowerScore

#47974088-21, Indoor, Grantsville, MD, Climate Zone 5A, July 2020 - June 2021

#### Whole Facility Year-Over-Year Energy 45th percentile Non-Electric Efficiency ® 188 kBtu/sqft ★ 30% better 71st percentile Emissions Efficiency 100th percentile Select a second PowerScore for comparison snapshot or Lighting Efficiency ® \* 87% better 2.820 kWh / day add another: 81st percentile #47974085-21. Motown Gro . HVAC Efficiency 392 kBtu / sa ft ■ 0% change 3<sup>rd</sup> percentile Overall: Middle-ofthe-Pack Your operation's overall performance within the data set of Water 94th percentile indoor facilities in PowerScore's Ranked Data Set: Water Efficiency ® 0.523 gal / sq ft ■ 8.2% worse 97th percentile 45<sup>th</sup> Waste 68th percentile percentile Come back to check your PowerScore regularly to see how Waste Efficiency 0.24 lbs / saft ■ 0% change your rank changes as more 80th percentile facilities benchmark their performance!

#### What data should you collect?

- Energy consumption
  - All fuel types
- Water consumption
- Water quality
- Production
- Use controls & automation systems to improve data collection
  - Improve understanding of subsystems

danesheldon@aquasgroup.com

- LED lighting is more than twice as efficient than HPS or MH lamps
- Lighting impacts flower yield, flower quality and plant architecture
- Diffused light increases yield by increasing light to lower foliage
- Excess humidity under light deprivation must be mitigated
- Water must not be allowed to stagnate
- Plan for multiple wastewater streams-some can be reused!
